Kestrel Loads Summary (fictional test sample)

Dynamic pressure: $q = \tfrac{1}{2} \rho V^2$

Mach number: $M = V / a$, where a is the local speed of sound.

Bending stress $\sigma_b = M_b \cdot c / I_x$ must stay below σ_y / n_s.

Reynolds number $Re = \rho V L / \mu$, where μ is the dynamic viscosity.

TRL = 6 and the total budget = $4.2M are not equations.
